

ScanViS ID Case Study

GateGuard all-in-one facial recognition system strengthens access control of a retail bank back office in Brazil

Project requirement

A retail bank back office in Brazil needed to strengthen security facility to provide a safer workplace and to protect premises when business expanded with increasing staff number.

How did GateGuard help?

ScanViS GateGuard access control solution was deployed in a retail bank premises in Brazil. It automated staff attendance recording and strengthened entry control to the restricted work zones with facial recognition technology.

Due to different access right and check-in time of the staff arrangement in the back office, and some important customer visits to the VIP rooms, the solution offers door control function, as well as user group and schedule setting via a user-friendly web GUI that simplified admin work yet ensured security need.

Results and Benefits

Automating attendance recording

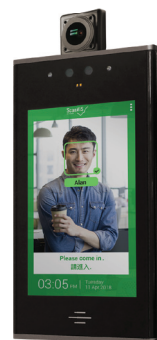

GateGuard devices streamlines admin work by automating staff attendance tracking with facial recognition technology to authorize entry.

Improving visitor management

Large capacity of face database gives scalability to manage more user groups in the system, while the busy back office has high degree of staff mobility checking in and out of the restricted work zones.

Real-time monitoring

The solution enables real-time access log monitoring via mobile app, allowing security personnel to take appropriate action in case of strangers appear.
